

TRABOWL TATTOO HAUS — AFTERCARE MANUAL

PREMIUM AFTERCARE SYSTEM

A masterpiece deserves professional preservation. Your new tattoo is an open wound and a permanent investment. Follow our clinical, multi-stage aftercare regime to ensure perfect healing and vibrant pigment retention.

IMMEDIATE CARE

STAGE 1: THE CRITICAL FIRST 24 HOURS

THE PROTECTIVE WRAP (SECOND SKIN / SANIDERM)

If your artist applied a medical-grade adhesive wrap (e.g., Saniderm), keep it on for **2 to 5 days** as instructed. It is waterproof and breathable, creating a sterile barrier.

Note: It is normal for fluid (ink, plasma, small amount of blood) to pool beneath the bandage. It may look "blurry" — do not panic. However, if fluid leaks outside the seal, or the wrap peels back to expose the tattoo, remove it immediately.

TRADITIONAL CLING FILM WRAP

If wrapped in traditional cling film, keep it covered for **2 to 4 hours**. Once removed, do not rewrap. Let your skin breathe.

FIRST CLEANSE

HOW TO WASH YOUR NEW TATTOO

- **Sterilize:** Always wash your hands thoroughly with antibacterial soap before touching your tattoo.
- **Gently Wash:** Use lukewarm water and a fragrance-free, antibacterial liquid soap. Do not use washcloths, sponges, or loofahs. Use your clean fingertips only.
- **Rinse:** Gently wash away all dried blood, plasma, excess ink, and ointment. Leaving plasma on the skin causes heavy scabbing.
- **Air or Pat Dry:** Let it air dry, or pat it gently with a clean, single-use paper towel. Never rub the tattoo.

TIMELINE

STAGE 2: THE HEALING JOURNEY (DAYS 2 TO 30)

Days 2 – 3: Dullness & Tightness

The tattoo will feel tight and look dull. Apply a very thin layer of premium aftercare lotion or fragrance-free moisturizer (such as Aquaphor or Easy Tattoo) 2–3 times daily. Keep it extremely light —your skin needs to breathe.

Days 4 – 14: Flaking, Peeling & Itching

The tattoo will start to peel and flake like a sunburn. It may look dry, cracked, and highly colorful flakes will shed. **Never pick or scratch!** Picking will pull ink out of the dermis, creating permanent blank spots. If it is intensely itchy, slap it lightly or apply moisturizer.

Days 15 – 30: Deep Structural Healing

The surface is healed, but the deeper layers of the dermis are still rebuilding. The tattoo may look slightly shiny or silver. Continue moisturizing daily to protect and nourish the new skin barrier.

THE DOS

- Wash 2–3 times a day with antibacterial soap.
- Apply ointment sparingly (thin glaze, no white clumps).
- Wear loose, clean, cotton clothing.
- Stay hydrated to keep your skin healthy.
- Trust the process and let scab flakes fall off naturally.

THE DON'TS

- **Never** scratch, pick, or peel dry flakes.
- **Do not** submerge in water (no swimming pools, lakes, baths, or saunas) for at least 3 weeks.
- **Do not** expose to direct sun until completely healed. Use SPF 50+ only after it has fully healed.
- **Do not** apply Vaseline or heavy petroleum jellies.

PIERCING

PIERCING AFTERCARE PROTOCOL

A new piercing is an entry point for bacteria. Strict adherence to cleaning is required to prevent infections and migration.

1. THE CLEANING SOLUTION

Use a sterile saline solution (0.9% Sodium Chloride) spray twice daily. Avoid home-made salt mixtures as they are rarely sterile and usually too strong, which dries out and irritates the tissue.

2. THE CLEANING ROUTINE

- Wash hands thoroughly before cleaning or touching.
- Spray the saline solution directly onto the entrance and exit holes of the piercing.
- Gently wipe away any softened crust or discharge using a clean cotton swab or sterile gauze. Do not rotate the jewelry.
- Pat dry with a clean paper towel. Moisture left around piercings can lead to bacterial growth and irritation bumps.

3. CRUCIAL RULES FOR PIERCINGS

- **Hands off:** Never touch, spin, or play with the jewelry.
- **Sleep safely:** Avoid sleeping directly on the piercing. Use a travel pillow to keep pressure off.
- **Downsizing:** Return to the studio at the scheduled time (typically 4–8 weeks) to downsize your jewelry post-swelling.

FAQ

FREQUENTLY ASKED QUESTIONS

Q: When can I work out or go to the gym?

A: Avoid intense, sweat-heavy workouts for the first 3 to 5 days. Sweat contains bacteria and can cause infection. Avoid machines where your new tattoo might directly touch shared equipment.

Q: Why does my piercing have a small bump near it?

A: This is usually an "irritation bump," not necessarily an infection. It is caused by friction, sleeping on it, improper cleaning, or wet conditions. Keep cleaning with saline, keep it dry, and do not touch it.
